Business Insights – Flipkart Smartphone Price and Specification Analysis

1. Product Listing Analysis: Identify the total number of smartphone listings and unique brands available in the scraped Flipkart sample.

2. Brand Performance: Determine which brand has the highest number of listings and which brands have fewer listings. A higher listing count does not necessarily mean higher sales or market share.

3. Price Distribution: Calculate the average, median, minimum, and maximum smartphone prices to understand the price range of the products.

4. Price Segment Analysis: Group smartphones into budget, mid-range, premium, and high-end price bands to identify the most represented segment in the collected data.

5. Brand Price Positioning: Compare the median prices of different brands to understand which brands are positioned at lower or higher price points.

6. RAM and Price Relationship: Analyze how smartphone prices vary across different RAM capacities to understand the pricing of phones with different memory configurations.

7. Storage and Price Relationship: Compare smartphone prices across storage capacities to evaluate how storage configurations relate to pricing.

8. Value-for-Money Analysis: Compare smartphones with similar RAM, storage, battery, and display specifications to identify potentially better-value options.

9. Battery Specification Analysis: Examine battery capacities across brands and price segments to understand the range of battery options available.

10. Display Specification Analysis: Compare available display specifications to understand the features offered at different price levels, where the scraped data supports the comparison.

11. Color Availability: Identify the most frequently listed smartphone colors and examine color availability across brands and models.

12. Product Specification Completeness: Measure missing values in RAM, storage, battery, and display columns. High missing-value rates may limit product comparisons and indicate a need for better product information.

13. Highest- and Lowest-Priced Smartphones: Identify the most expensive and least expensive listings in the sample to understand the extremes of the collected price range.

14. Pricing Opportunities: Identify brands or price segments with fewer listings in the sample. These may be worth investigating further, but listing gaps alone do not prove unmet customer demand.

15. Price Monitoring Opportunity: Repeatedly collect prices over time to track price changes and discounts. A single scraping session cannot establish price trends.

Recommended Business Actions

- Improve product specification completeness where important details are missing.
- Compare prices only between smartphones with reasonably similar specifications.
- Use brand and price-segment analysis to support assortment and pricing decisions.
- Monitor prices periodically to identify potential discounting opportunities.
- Treat listing counts and review counts as indicators about the scraped listings, not as direct measures of sales, customer demand, or market share.
